EXP 12	Implementing security and governance in a low-code application

Aim:

To implement security and governance in the **Event Registration System** using roles, permissions, data sharing and validation rules in Zoho Creator.

Theory:

Security protects the application and its data from wrong access. **Governance** means having clear rules on who can build, change, use and see the application and its data. In low-code platforms, many people can build apps, so governance is very important.

- **Authentication:** Users sign in with their Zoho account before using the app.
- **Authorization:** Roles and permissions decide what each user can do.
- **Data protection:** Data sharing rules control who can see the records.
- **Data quality:** Validations and mandatory fields stop wrong data from being saved.
- **Audit and control:** Logs, version history and environments keep a record of changes.

Scenario:

In the Event Registration System, participant details such as name, email and phone number must be kept safe. Only the CEO should change settings, the Event Coordinator should manage events, and Participants should only register.

Procedure:

1. Open the Event Registration System and go to **Settings**.
2. Open **User Permissions** and check the permission profiles.
3. Create roles: CEO, Event Coordinator and Participant.
4. Set the role hierarchy so that higher roles can see the data of lower roles.
5. Check the **Data Sharing** settings for the forms.
6. Check the form validations (mandatory fields, email format, participant count).
7. Use Environments so that changes are tested before going live.
8. Record the security and governance measures.

Output:

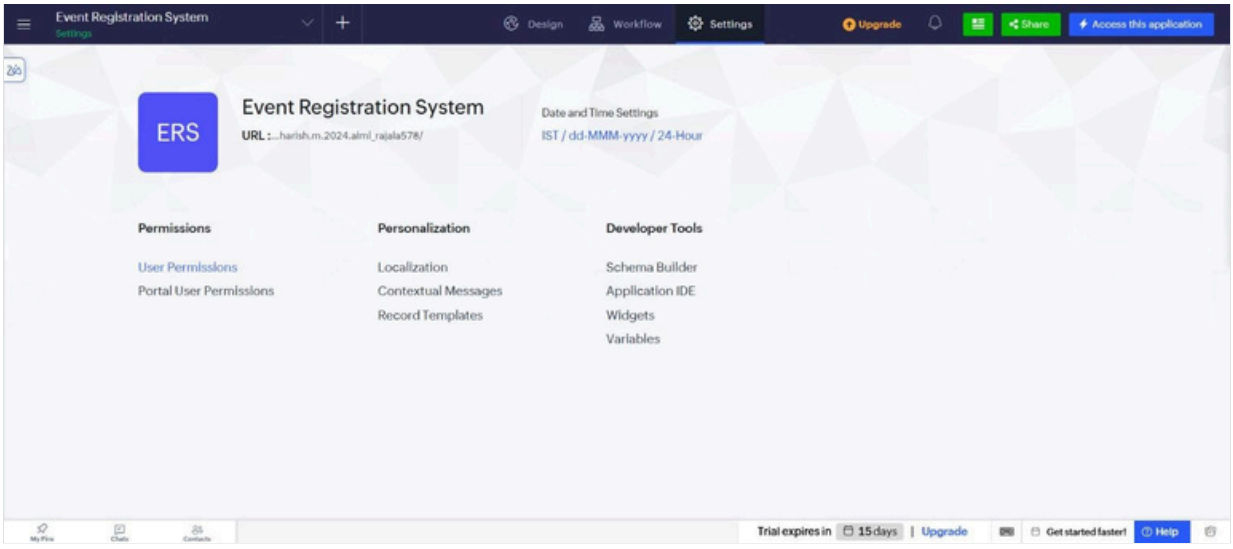

Fig. 12.1: Application Settings

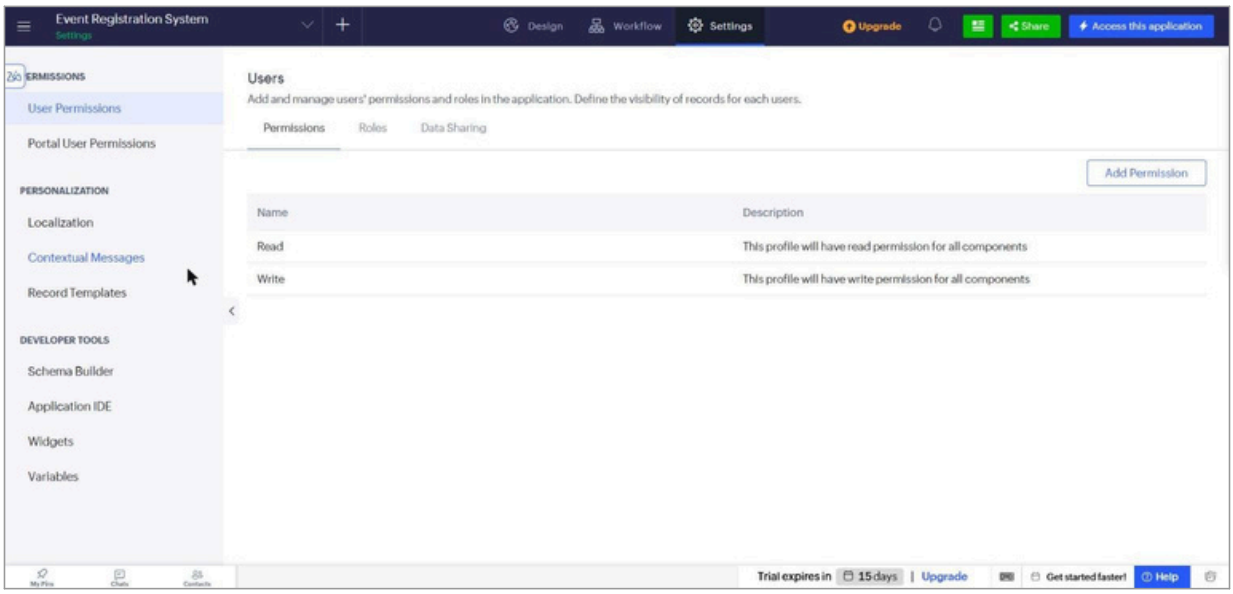

Fig. 12.2: Permission Profiles

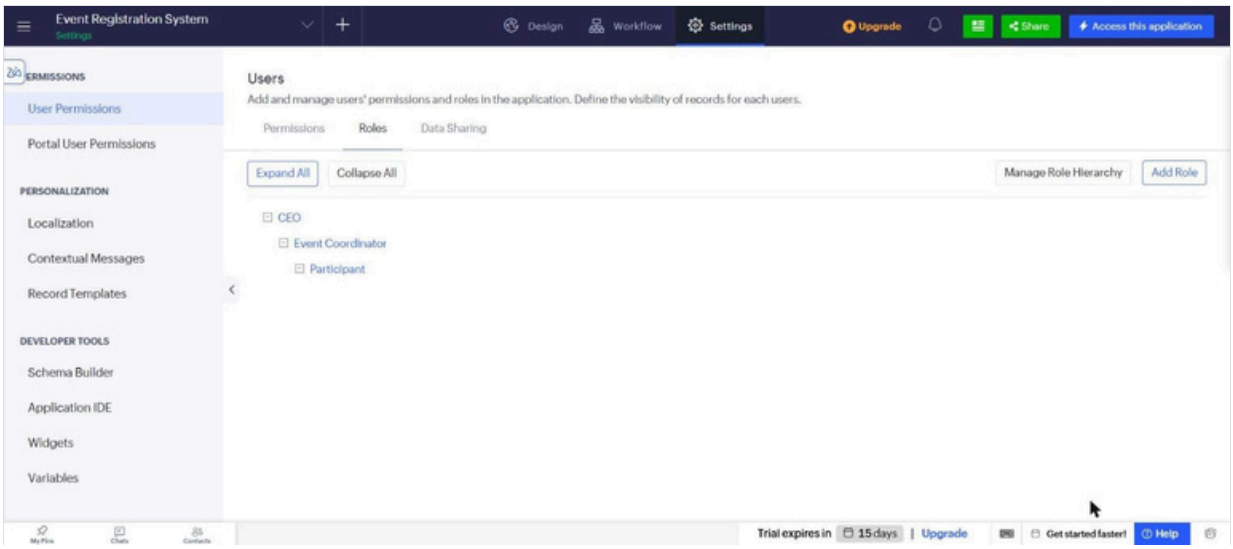

Fig. 12.3: Role Hierarchy

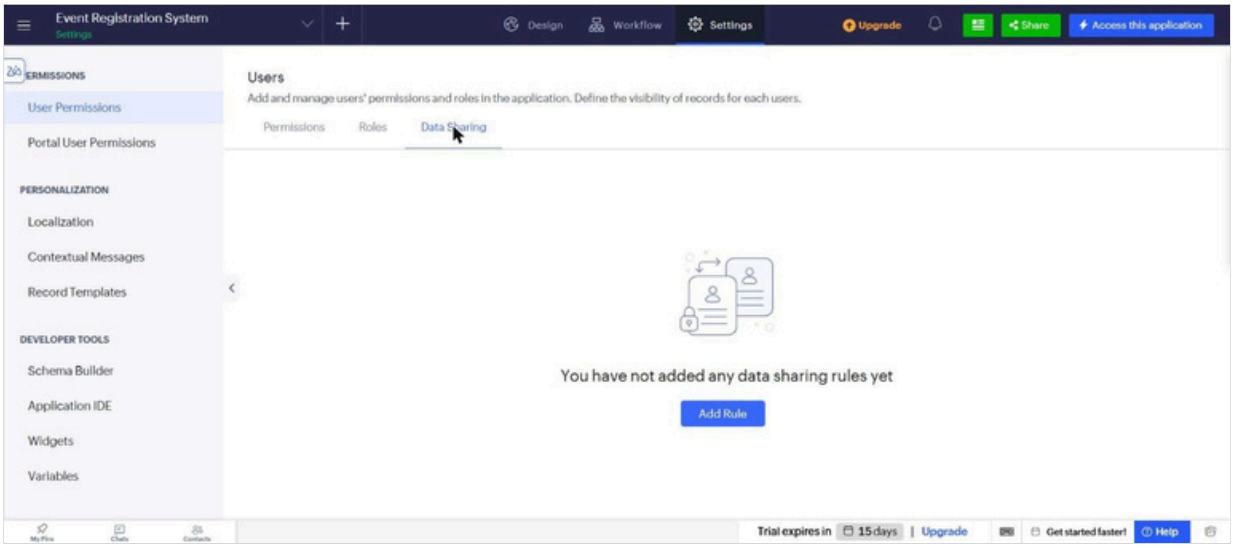

Fig. 12.4: Data Sharing Rules

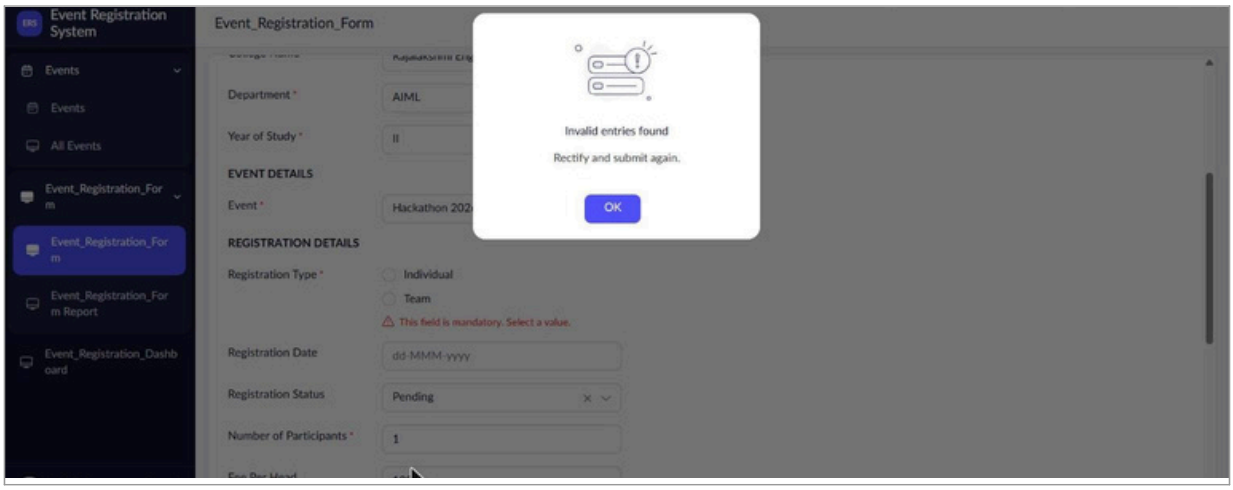

Fig. 12.5: Validation Stops Incomplete Data

Observation:

Security / Governance Measure	How it is done in the App
Sign-in	Zoho account login
Role-based access	CEO, Event Coordinator, Participant roles
Data visibility	Role hierarchy and data sharing rules
Data quality	Mandatory fields and Deluge validations
Change control	Development, Stage and Production environments
Audit	Logs and Version History

Result:

Security and governance were implemented in the Event Registration System using roles, permissions, data sharing, validations and environments in Zoho Creator.
